

Figure 1: Comparison of the two methods. The top panel shows the results of the first method, and the bottom panel shows the results of the second method. The x-axis represents the parameter space, and the y-axis represents the performance metric. The legend indicates the different components of the analysis.

The results show that the second method consistently outperforms the first method across all parameters. This is particularly evident in the regions where the performance metric is high, indicating that the second method is more robust and accurate.
