IDENTIFYING THE EXTENT OF THE PROBLEM: The first part of any prediction of repeat victimisation (RV) involves establishing the impact that RV and near-repeat victimisation (NRV) has on local crime levels.

There a number of ways you can measure the level of RV. The simplest is to use one year of recorded crime data and identify those victims that appear more than once. This can be done for repeat locations by identifying c 0.9n be   yearwneartixt tiyt
