KEY MESSAGES

- A green economy strategy will address economic vulnerabilities and long-term weaknesses and drive a robust recovery from recession.
- T eUK risks losing its current competitive advantage in key green innovation.
- T e costs of moving to a green economy are lower than are under-estimated.
- T e green economy refers to the whole of the economy, not just the environmental sectors ere is a crucial role for Government in steering towards a green economy.
- Key recommendations for moving to a green economy are:
- Agreen industrial strategto drive eco-innovation and secure competitive advantage in green technologies
- Prioritisation of infrastructure projects which ensures that investments are compatible with long-term green economy objectives
- A new information infrastructure provide natural capital and material ow accounts for the economy, together with improved corporate reporting and enhanced consumer information.

Greening the Recovery

The report of the UCL Green **Economy Policy Commission**

Rationale for a green economy strategy

- e UCL Green Economy Policy Commission (GEPC) identi es six key points which underpin the rationale for a green economy:
- 1. A concern for the environment and a recognitio inthat long term we have to shift to a more sustainable growth path Our economy is highly vulnerable to climate change, degraded natural capital and resource constraints, and our wellbeing dependent on the quality of the environment and on natural resources.
- 2. Many of the structural reforms required for a green economy are necessary even without the green imperative akes sense to make such structural reforms in a way that drives the transition areas of innovation and technology without taking steps to fosted the long-term goal of a low-carbon, resource-e cient green economy.
- 3. ere are short-term costs, but these are lower than is often supposed - direct costs are often over-estimated, and the pay-o supposed Empirical evidence shows that the predicted costs of environmental policy have almost always been overestimated in the past. ere are also economic pay-o s to environmental policy that mean the net costs may be less than is typically expected.
 - 4. Delay is likely to be even more cost Failure to act early, and synchronously with cycles of investment and re-investment, is expensive because of lock-in and path depender Decisions made today enable or constrain options in the future.
 - 5. e fragility of the recoveryalso provides a reason for pursuing a green economy now. Whilst the economy is operating below full capacity there is a window of opportunity during which resource costs are low and the added bene ts of stimulating directed investment (particularly in infrastructure and innovation) are large.
 - 6. e rest of the world is moving in this direction Analysis of patent data and global innovation policy suggests that rest of the world is increasingly oriented towards greener innovation – the Uk risks losing its leadership in areas of present comparative advanta

Information Conclusion

Adequate, timely and relevant information is essential for the understanding of the state of an economy and where it is head to be policy for a green economy will: but we lack the information about material and resource use that strengthen the UK economy by renewing infrastructure, enables economic actors and policymakers to understand and stimulating innovation and increasing resource productivity; manage the resource and environmental basis of the economy and businesses. We recommend:

- the construction of a system of natural capital accounts increase understanding as to how and where natural capital should be daily environmental experience and quality of life of be maintained and augmented, and to act as an interface between citizens; the economy and the environment;
- the construction of much more detailed material ow accounts for the UK economy that will track the ow of di erent materials A clear, credible and long-term green strategy can lower risk through the economy;
- an information system for investment and supply chain management through Resources and Environment Reporting Council to develop indicators for resource use and improved
- improvements in consumer information which should be

and resource ef ciency

e costs of moving towards a green economy are lowest when there are strong signals to investors and to business that the Government is committed to doing so. Macro-economic policy, including environmental tax reform and ensuring that infrastructure and innovation spending is targeted to support a green economic recovery, is crucial to demonstrate policy cred and stability. We recommend:

- establishing widespread green scal reformthrough a Fiscal Commission for a Green Economy
- reform of carbon pricing in partnership with the EU
- increasing VAT on household energy use
- issuing index-linked policy-performance bonds

We also make a number of speci c recommendations at UK and EU level tomprove resource e ciencywhich encompass: economic instruments; regulations; waste and energy e ciency product passports; environmental taxes; green public procurer and eco-design.

• build UK comparative advantage, capability and exports in growing global markets;

• give the UK a leading voice in global political discourse on increasingly important resource and environment issues.

premiums and galvanise private investment. A national strategy to drive forward investment in resource-e cient, innovative sectors could both restoregrowth and leave a lasting legacy.

e green economy is moving from a desirability to a necessity. corporate accounting, including through con dence accounting; ere is a window of opportunity, as the UK emerges from recession, to implement policies which will green the recovery and embedded in policy packages, rather than supplied in isolation put the UK economy decisively on a trajectory towards low-carbon prosperity, resource security and environmental quality. Enabling policies: macro-economic policy e direction the UK economy takes in recovery and the extent to which it addresses its vulnerability to climate instability and resource availability will largely determine whether growth can be sustained for the long-term.

MORE INFORMATION

The report of the UCL Green Economy Policy Commission was launched on 24 February 2014. The full report is available to download from the UCL Public Policy website,
